

CAROLINE

Acoustic testing based on airborne and structure-borne sound

- · use in development, testing and series production
- · synchronous recording of up to 8 acoustic measurement channels
- · I/O resources for triggering, gate control and synchronization
- · standard interfaces for integration into complex production lines or end-of-line testing systems
- · comprehensive visualization and analysis functions including machine learning (AI)
- · monitoring option of acoustic data recording using headphones
- · offline version to create or edit test sequences with the help of simulated measurement data

CAROLINE Acoustic testing based on airborne and structure-borne sound

- analysis and evaluation of the data with the help of classical mathematical methods
- · order analysis, bandpass, thirdoctave analysis, roughness, tonality etc.

Data acquisition

- testing of UUT in various operating states and load modes
- · data recording for signal analysis using CAROLINE system

Structure-borne sound

- · analysis of vibrations and natural frequencies of electromotive assemblies
- · insulated recording of UUT against external noise during test
- · sensors can be mounted magnetically or · by spring force

Measurement method

- determination of the driving speed via measurement of the current ripple or the hall signal by the signal conditioning module
- · direct measurement of sensor signals

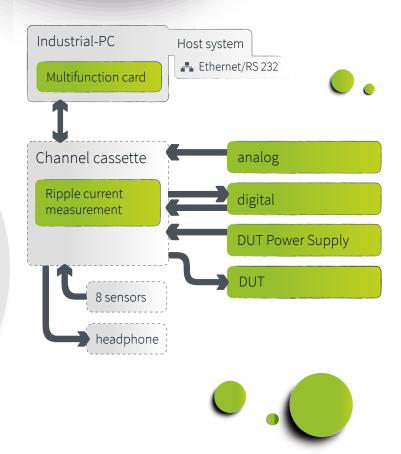

Parameters	
A/D converter	16 bit
sampling rate	44.1 kHz
sensor inputs	8 IEPE inputs
analog inputs	2 inputs ±100 V differential
digital inputs	2 inputs 30 V potential-free
sensor supply IEPE	4 mA, can be individually switched off
sensors	microphones, structure-borne sound sensors, laser vibrators, force sensors etc.

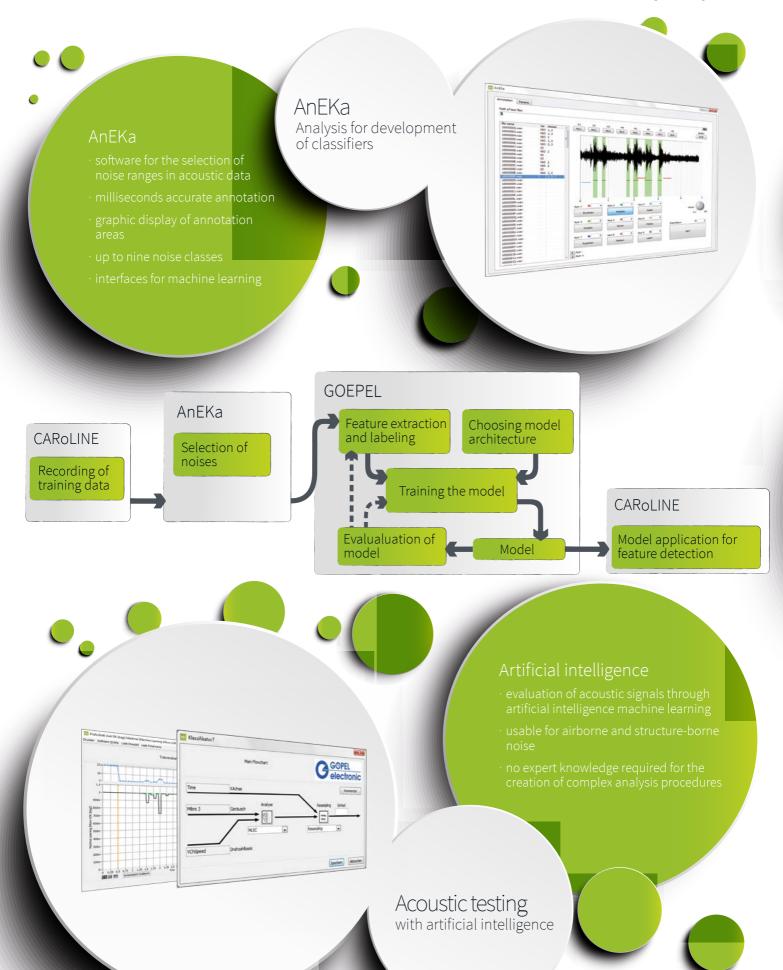

Sensors

- · sensors with integrated IEPE amplifie
- · power can be switched off by channel cassette
- \cdot connection of different sensors possible
- structure-borne sound sensors can be mounted magnetically or by spring force
- · positioning of the microphones at the test system near the IJIT
- sensors have to be acoustically decoupled from the base frame of the test system

Preparation

- creation of individual test sequences with existing or own modules and analysis functions
- · user guidance for creation of own features
- · setting of reference variables and trigger conditions

Analysis features

- · speed determination from hall signal or current ripple
- · order analysis, third octave analysis
- · psychoacoustic evaluations (roughness, tonality)
- · automatic tolerance band creation on the basis of a defined number of UUT data
- · statistic function, spread pattern display
- · models of machine learning

Trigger sources

- · level of incoming noise signal
- · threshold value at analog inputs
- · status change at digital inputs
- · command from the higher-level system via the host interface

Sequence Control

predefined time interval

Evaluation

- · evaluation of the results during a test sequence parallel to data recording
- · visualization of a completely evaluated data block every 100 ms
- · choice between temporal or positiondependent display (e.g. adjustment track or angle of rotation)
- · evaluation of the recorded noise signals based on analysis indices (ANI)

Host system

Ethernet/RS 232
